Care
Networks

Clinical Leadership
i.e. supporting clinical governance of integrated services, teams & care pathways.

- Processes & systems to enable integrated care**
- Integrated management of clinical workforce, with single lines of accountability, across hospital and community settings to meet population needs
 - Shared KPIs and responsibility for achievement of targets and outcomes across the IHA
 - Regional care networks

- Key Features**
- The focus of the IHA is on the health of the population across the continuum of care from living well at home to inpatient care
 - A geographic, population-based model at all levels within the Health Region which builds on the established Community Healthcare Network structure
 - All community health & social care services provided to populations of average 50k are managed together as one unit, within a restructured CHN with expanded remit
 - Regional Care Networks are designed to ensure consistency in standards of practice and service models across regions. These networks are integral to the delivery of integrated care and are grounded in national models of care.
 - All hospitals including Model 4 hospitals report into the IHA manager. It is envisaged that specialist services provided by Model 4 hospital would be governed at regional level reflecting the regional and supra-regional remit of this work.
